M.A.S.

s.a.m. sensorised ablative microvibration

Sensorised Ablative Microvibration is a revolution in non-invasive facial treatment.

Ablative Microvibration is carried out via a handpiece designed specifically to ensure that the exfoliating action creates continuity with the FACE treatment. The tissue is subjected to a particular friction which has the purpose of **smoothing the epidermis**, applying greater pressure on the protruding areas compared to those that are depressed, thus obtaining the exfoliating effect.

The gel microspheres are positioned on a rotation axis and offset by 13.7° . The traction caused on the tissue by the combined action of the position and movement of the spheres cause a **removal of the surface layer of dead cells, favouring the oxygenation and regeneration of the tissue**. The procedure, which is **painless**, is a new solution for the prevention of premature aging of the skin.

RESULTS AFTER THE FIRST SESSION

EXFOLIATING EFFECT

The specific positioning of the spheres enables the roller to carry out a convergent or divergent action on the epidermis that, thanks to the friction on the tissue, causes an exfoliation of the stratum corneum, for a mechanical peeling effect that smoothes the tissue and improves its appearance, stimulating tissue regeneration.

RESULTS

IMPROVEMENT
of TEXTURE of the SKIN

TIGHTENING
of FACE OVAL

SOFT PEELING

INCREASED BRIGHTNESS

CLINICALLY TESTED

FACE

sensorized compressive microvibration

The new **FACE** handpiece, characterized by an innovative and ergonomic design, is the latest evolution in facial treatments with the Endosphères® Compressive Microvibration method. There are **three fundamental innovations** that make it possible to reduce working times and significantly increase final results:

SENSOR SYSTEM

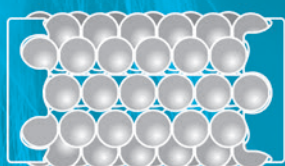

The sensor system and led pressure bar located on the handpiece **optimizes the work of the operator** by indicating the correct pressure to be applied based on the type of tissue detected: this gives an unprecedented result;

DENSITY OF SPHERES

The microspheres are made from an exclusive patented gel, with a 15 shore density, there by **acting in-depth and with more accuracy on wrinkles**, for a result without any pain or discomfort to the patient;

SELF-LUBRICATING SLIDING SYSTEM

The unique technological innovation created by Fenix Group engineering department **reduces to a minimum friction on the tissue**, making it possible to work in dry conditions, amplifying and accentuating the mechanical effect of Compressive Microvibration.

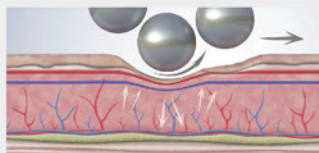

35 shore silicone

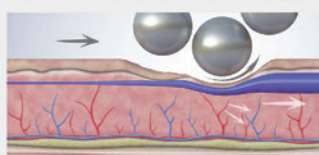

15 shore gel

ACTS ON MICRO-CIRCULATION

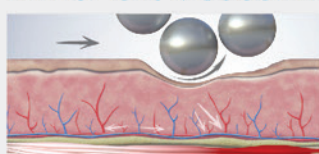

The particular bee-hive disposition of the spheres in the cylinder, induces a pressure and lift, a kind of vascular gymnastic that allows an improvement of the microcirculation in the interested areas.

LYMPHATIC DRAINAGE

Endosphères Therapy® produces a rhythmic pulsing action according to the direction of cylinder rotation and acts on lymphatic system by draining toxins that have built up creating the ideal base for the absorption of nutrients by the skin.

EFFECT ON MUSCULAR HYPERCONTRACTION

The Compressive Micro-Vibration system uses muscles as active resistance during the treatment allowing muscles of the face and neck to relax so as to show a relaxed and natural looking complexion.

RESULTS

WRINKLE REDUCTION

INCREASE in THICKNESS
of TISSUE

TISSUE
VASCULARIZATION

REDUCTION in FACIAL
EXPRESSION WRINKLES

INCREASED TISSUE
and MUSCULAR TONE

IMPROVEMENT of SKIN
and MUSCLE STRUCTURE
of the FACE

100% NON-INVASIVE

V.E.V.

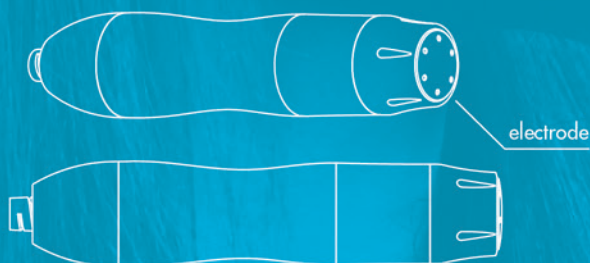

v.e.d. vibro-electro-delivery

The EVA protocol ends with phase III.

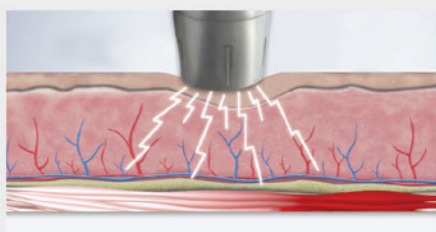

V.E.V., Vibro-Electro-Delivery, facilitates the transmission of active ingredients to the tissue, thanks to electric square-wave pulses.

The peculiarity of the treatment is in the **perfect combination and consequentiality of the three phases**. In fact, V.E.D. exploits the opening of the pores resulting from the Compressive Microvibration treatment and exfoliation through M.A.S., reducing the resistance of the dermis and **facilitating the entry of substances in a solution**.

Electric transmission creates a **contrast between the positive and negative** ends enabling the substance to be attracted inside the tissue. Scientific studies show that electrical pulses have greater effectiveness when their shape is square and symmetrical, both in order to facilitate pulsing to the dermis and create stimulation up to the muscular level. Moreover, the larger irradiation area given by the squared shape of the wave makes it possible to **optimize working times**, thanks to the greater intensity, and thus effectiveness, of the treatment.

CARRIER ACTION

Thanks to the specific characteristics of the handpiece and the specific consequentiality of the treatment protocol, the carrier action allows for the transmission of the active ingredient with greater efficiency and reduced working times, stimulating the underlying muscle component.

RESULTS

The treatment gives significant results for:

WRINKLES

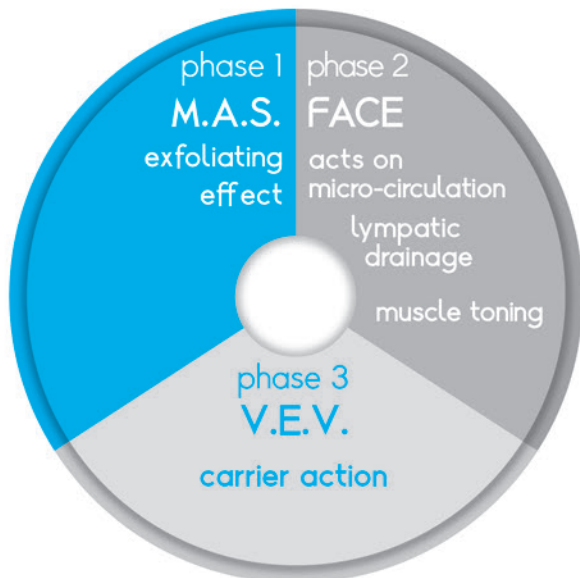

UNDEREYE BAGS

DARK CIRCLES

SKIN DISCOLOURING

TONING

RELIABLE RESULTS

e/a

The innovative **EVA** device is a highly technological concept designed to implement a **complete treatment protocol** for face rejuvenation, starting from Compressive Microvibration to widen the field of action towards other types of therapy. The protocol is divided into **three phases** tissue preparation and stimulation, and which evolves in the course of treatment and makes it possible to obtain **unique results**.

The device has three handpieces, each one with a specific function. **EVA** is in fact a modular system with three handpieces that combine perfectly with one another.

- 100% NON-INVASIVE
- REPEATABLE
- EXTRAORDINARY EFFECTIVENESS FROM THE 1ST SESSION
